

Ride Operations & Revenue Intelligence

Data Analytics Report

Executive Summary

This report presents a comprehensive analysis of Uber ride operations data, covering booking outcomes, revenue patterns, vehicle performance, driver behaviour, customer satisfaction, and payment trends. Key findings reveal a strong completion rate, significant driver cancellation volumes, and a UPI-dominated payment ecosystem — with actionable recommendations for improving supply coverage, reducing cancellations, and maximising weekend revenue.

Analysis Period: FY 2024 | Data Source: Uber_Data_Analytics.csv
Prepared by: Data Analytics Team | Classification: Internal

1. Key Performance Indicators

The table below summarises top-level platform metrics across the analysis period.

~93K Completed Rides	~27K Driver Cancellations	~11K No Driver Found	84.7% Drivers Rated 4–5★
₹1.29Cr Auto Revenue (Top)	~46K UPI Payments	18:00 Peak Booking Hour	~50% Weekend Revenue Premium

2. Booking Status Distribution

Analysis of overall ride outcomes reveals strong completion rates alongside persistent cancellation and supply issues.

Booking Status — Key Findings

- 1. Completed rides dominate at ~93K:** The platform's core function is working — but the real story lies in the 30%+ of rides that fall short of completion.
- 2. Driver cancellations are alarmingly high at ~27K:** Nearly 1 in 4 non-completed rides is abandoned by a driver, signalling incentive misalignment or selective ride-picking.
- 3. ~11K rides found no driver at all:** This is a pure supply problem — certain areas or peak hours remain chronically underserved.
- 4. Incomplete rides (~9–10K) are a hidden risk:** Small relative to completions, but each one represents a broken experience that erodes trust.
- 5. Customer cancellations (~11K) likely mask supply frustration:** The near-identical count to 'No Driver Found' suggests many customers cancel after prolonged waits.

3. Revenue by Vehicle Type

Vehicle type is the most significant revenue differentiator, with budget and mid-range categories vastly outperforming premium segments.

Vehicle Type	Revenue & Commentary
Auto	₹1.29 Cr — Revenue leader; high volume, affordable price point
Go Mini	₹1.04 Cr — Exceptional performance for a budget category
Go Sedan	₹93 L — Solid mid-tier; comfortable commuter segment
Premier Sedan	₹79 L — Premium but underperforming relative to potential
Bike	₹63 L — Limited penetration; infrastructure dependent
eBike	₹36 L — Early stage; infrastructure and adoption barriers
Uber XL	₹15 L — Niche product with no clear product-market fit yet

 Revenue by Vehicle Type — Key Findings	
1. Auto is the undisputed revenue king:	At ₹1.29Cr, it dominates by hitting the affordability-availability sweet spot most riders want.
2. Go Mini punches well above its weight:	₹1.04Cr from a budget option proves high-volume, low-cost rides can outperform premium categories.
3. Go Sedan holds the mid-tier solidly:	₹93L shows a consistent demand segment for comfort without premium pricing.
4. Bike and Premier Sedan are underdelivering:	Both need investigation into supply levels, pricing, and promotional investment.
5. eBike and Uber XL are near-irrelevant:	At ₹36L and ₹15L respectively, neither category has found traction and may need a strategic review.

4. Driver Cancellation Analysis

Driver cancellations are distributed across four distinct root causes, each requiring a different operational response.

Cancellation Reason	Estimated Count & Root Cause
Personal & Car Related Issues	~6,500–8,000 rides — Fleet/driver support gap
Customer-Related Issues	~6,000–7,500 rides — Booking quality or communication gap
Overcrowding (Too Many Passengers)	~6,000–7,000 rides — UX/policy enforcement gap
Sick Customer	~6,000–7,000 rides — Post-COVID health sensitivity

 **Driver Cancellation Reasons — Key Findings**

1. **All cancellation reasons are nearly equal in volume:** No single cause dominates — meaning there is no single fix, but multiple parallel interventions are needed.

2. **Personal & car issues signal an ops support problem:** Poor fleet maintenance culture or driver overwork is preventable with better scheduling and support.

3. **Overcrowding cancellations should not exist:** The app should detect group size at booking — this reason is an UX failure, not a driver failure.

4. **Sick customer cancellations reflect a lasting post-COVID norm:** A formal health disclosure policy or masking option could reduce friction for both parties.

5. **Customer-related issues need deeper categorisation:** This bucket is too broad to act on — granular sub-reasons are needed to design targeted solutions.

5. Booking Value Distribution

The platform's revenue model is overwhelmingly volume-driven, with the majority of rides concentrated in low fare brackets.

Booking Value Distribution — Key Findings

- 1. Most rides are priced below ₹200:** ~60K+ rides cluster in the lowest booking value band — this is fundamentally a high-frequency, low-margin platform.
- 2. Revenue collapses past ₹500:** Bookings drop sharply after ₹500, indicating strong price sensitivity and short average trip distances.
- 3. A mid-range cluster exists between ₹200–₹600:** A secondary segment of slightly longer commutes (likely sedan or AC cab users) provides a modest revenue buffer.
- 4. High-value rides (₹1000+) exist but are rare:** The long tail to ₹4000+ shows premium rides happen, but the platform hasn't cracked this segment at volume.
- 5. Strategy implication — optimise for volume, not value:** Driver retention and operational efficiency are more important levers than premium tier upselling.

6. Ride Distance vs. Revenue

Contrary to expectation, ride distance is only a moderate predictor of fare — other pricing variables dominate.

Ride Distance vs Booking Value — Key Findings

- 1. Distance only explains ~18% of fare variance ($r=0.42$):** Vehicle type, surge pricing, and time-of-day are doing the heavy lifting in fare calculation.
- 2. Short rides (0–10km) show the widest price range:** Fares vary from ₹0 to ₹4000+ for the same distance — premium bookings on short trips are common.
- 3. A consistent ₹500–₹2000 base band exists across all distances:** Standard ride pricing reliably lands here regardless of trip length.
- 4. High-value rides (₹3000+) appear at every distance:** Premium vehicle bookings for very short trips confirm that convenience is often valued over cost.
- 5. Pricing may be inefficient at long distances:** Even 40–50km rides span the full revenue range, suggesting the long-haul fare structure needs review.

7. Driver Ratings Analysis

The driver rating distribution reveals classic rating inflation — a surface-level positive picture masking a meaningful quality tail.

Rating Category	Share of Drivers
High (4–5 stars)	84.7%
Medium (2–4 stars)	15.3%
Low (0–2 stars)	~0.0%

 Driver Ratings Distribution — Key Findings

1. **84.7% of drivers rated 4–5 sounds positive but isn't exceptional:** In ride-hailing, 4+ is the baseline expectation — it signals acceptability, not quality.

2. **15.3% in the medium tier represents a daily churn risk:** Roughly 1 in 6 drivers is delivering a below-average experience quietly and at scale.

3. **Near-zero low ratings reflect inflation, not absence of bad rides:** Customers rarely rate below 3 even after a poor experience — the low tail is suppressed by social norms.

4. **The rating system needs more nuance:** A binary High/Medium split makes it impossible to distinguish outstanding drivers from barely acceptable ones.

5. **15% medium-rated drivers at scale means thousands of bad rides daily:** This is not a rounding error — it is a structural quality problem that needs active management.

8. Hourly Demand Patterns

Ride demand follows a clear dual-peak pattern with the evening surge significantly outstripping the morning one.

Time Window	Volume & Interpretation
Peak Hour	18:00 — ~12,500 rides (evening commute dominates)
Morning Peak	09:00–10:00 — ~9,500 rides (weaker than evening)
Midday Trough	12:00–14:00 — ~5,500–7,000 rides (natural low)
Late Night	22:00–23:00 — ~5,500–8,000 rides (consistent demand)
Dead Hours	00:00–04:00 — ~1,400–1,500 rides/hour (lean but real)

Bookings by Hour — Key Findings

1. Evening peak at 18:00 is the single biggest hour:

Driver supply must be maximised between 17:00–19:00 — this is the highest-value window of the day.

2. Morning peak is weaker than expected:

Many users have flexible morning start times or use alternative transport for outbound commutes.

3. Midday trough is a clear opportunity window:

12:00–14:00 is ideal for driver maintenance scheduling, targeted promotions, and incentive resets.

4. Late-night demand is consistent, not occasional:

A reliable 22:00–23:00 segment deserves dedicated supply and safety features, not afterthought coverage.

5. Early morning hours (00:00–04:00) are never zero:

A small but loyal base of shift workers and airport travellers needs reliable lean supply.

9. Payment Method Analysis

UPI dominates real payment transactions, reflecting India's digital payment maturity — while a large unclassified bucket requires data quality attention.

Payment Method	Estimated Count & Commentary
Not Applicable (unclassified)	~48K — Data quality issue requiring investigation
UPI	~46K — Dominant real payment method
Cash	~26K — Significant and must not be ignored
Uber Wallet	~12K — Underutilised loyalty lever
Credit Card	~10K — Largely bypassed by Indian users
Debit Card	~8K — Lowest adoption among digital methods

Payment Method Distribution — Key Findings

1. The 'Not Applicable' category is a data quality red flag: ~48K unclassified rides must be investigated and resolved before any payment analysis is reliable.

2. UPI is the clear winner at ~46K transactions: Expected in the Indian market — the platform is aligned with how users actually pay.

3. Cash is alive and significant at ~26K rides: A quarter of trackable payments are cash — this segment cannot be dismissed or marginalised.

4. Cards have been leapfrogged entirely: Indian users went from cash directly to UPI — card optimisation is a low priority.

5. Uber Wallet at ~12K signals an underutilised loyalty opportunity: Wallet users are typically high-frequency repeat customers — driving adoption here could lock in loyalty.

10. Cancellation Rates by Vehicle Type

Cancellation rates vary across vehicle categories and reveal category-specific supply dynamics.

Cancellation by Vehicle Type — Key Findings

- 1. Auto has the highest completions AND the highest driver cancellations:** ~6,500 driver cancellations against ~23K completions — Auto drivers are the most selective, likely due to high demand giving them negotiating power.
- 2. Go Mini has the healthiest cancellation ratio:** ~18,500 completions with proportionally lower cancellations — Go Mini drivers are more reliable and this category deserves supply investment.
- 3. Go Sedan has a disproportionate driver cancellation problem:** ~5,000 cancellations against ~16,500 completions — sedan drivers may be rejecting less profitable shorter routes.
- 4. eBike and Uber XL show low engagement across all metrics:** Neither category has found product-market fit — both need fundamental positioning review.
- 5. 'No Driver Found' is a platform-wide problem, not category-specific:** Every vehicle type shows a meaningful 'No Driver Found' bar — supply shortages require a platform-level supply strategy, not category fixes.

11. Revenue by Day of Week

Weekend revenue significantly outpaces weekdays, creating both an opportunity and an operational risk if driver supply is inadequate.

Day	Revenue & Pattern
Saturday	~₹9.7 Cr — Weekend peak
Sunday	~₹9.6 Cr — Weekend peak
Friday	~₹6.7 Cr — Marginal weekend uplift only
Monday–Thursday	~₹6.4–6.6 Cr — Flat, predictable weekday baseline

Revenue by Day — Key Findings

1. Weekends deliver a ~50% revenue premium over weekdays: Saturday and Sunday at ~₹9.6–9.7Cr vs weekday ~₹6.5Cr is a massive gap that must drive surge strategy and driver incentives.

2. Weekdays are flat across the board: Monday–Thursday barely differ, confirming a strong, predictable daily commuter base — operationally valuable.

3. Friday underperforms its position as weekend gateway: Only marginally higher than other weekdays — surge pricing and targeted promotions on Friday evenings need strengthening.

4. Weekend premium is a double-edged sword: If driver supply doesn't scale to match weekend demand, the platform is leaving its highest-opportunity hours underserved.

5. Weekday revenue stability is an underrated strength: Consistent ₹6.4–6.7Cr Mon–Thu means a reliable revenue floor from habitual commuter users — protect this base.

12. Feature Correlation & Revenue Drivers

Correlation analysis highlights that distance is the only meaningful numerical predictor of fare, while ratings are completely decoupled from commercial performance.

Feature Pair	Correlation & Implication
Booking Value vs Ride Distance	$r = 0.42$ — Only meaningful correlation
Driver Ratings vs Booking Value	$r \approx 0.00$ — No relationship
Customer Rating vs Booking Value	$r \approx 0.00$ — No relationship
Driver Ratings vs Customer Ratings	$r = -0.001$ — Completely independent

 **Correlation Heatmap — Key Findings**

1. **Booking Value and Ride Distance are the only meaningfully correlated pair ($r=0.42$):** Distance explains less than 20% of fare variation — the rest comes from vehicle type, surge, and time.

2. **Ratings have zero correlation with any commercial metric:** How much customers pay or how far they travel has no bearing on the rating either party gives — satisfaction is driven by unmeasured experience quality.

3. **Driver and Customer ratings don't correlate with each other:** Both parties are rating entirely different aspects of the same ride.

4. **Near-zero correlations are a signal to look elsewhere:** Wait times, cancellation rates, location, and time of day are the missing variables needed for actionable analysis.

5. **The heatmap is effectively a two-variable story:** The only actionable number is 0.42 — the dataset needs richer features before correlation can guide decisions.

13. Strategic Recommendations

Based on the full analysis, the following priority actions are recommended:

Priority 1: Fix Driver Cancellations

- Introduce dynamic cancellation penalties with real-time tracking to disincentivise selective ride rejection.
- Add group size capture at booking to eliminate overcrowding cancellations entirely.
- Develop a formal health disclosure option to reduce sick-passenger friction.
- Introduce driver wellness scheduling to reduce personal/car-related cancellation rates.

Priority 2: Solve the Supply Coverage Gap

- Deploy targeted driver incentives in zones and hours with the highest 'No Driver Found' rates.
- Run supply-demand modelling by hour and location to pre-position drivers before peak windows.
- Build dedicated 18:00 evening surge protocols — this is the highest-value hour and supply must match demand.

Priority 3: Maximise Weekend Revenue

- Activate driver weekend bonus schemes to ensure supply matches the ~50% premium demand increase.
- Strengthen Friday evening surge pricing to capture the untapped weekend gateway opportunity.
- Investigate whether 'No Driver Found' rates spike on weekends — if so, this is compounding lost revenue.

Priority 4: Fix Data Quality

- Investigate and reclassify the ~48K 'Not Applicable' payment records — these are masking the true payment distribution.
- Add granular sub-reasons to the 'Customer-Related Issues' driver cancellation bucket.
- Enrich the dataset with surge multiplier, time-of-day flag, and zone-level supply-demand ratio for deeper correlation analysis.

Priority 5: Leverage Growth Channels

- Drive Uber Wallet adoption — wallet users are high-frequency repeat customers and a loyalty lock-in vehicle.
- Continue investing in Auto and Go Mini supply — these two categories generate ~₹2.33Cr combined and are the platform's revenue engine.

- Review eBike and Uber XL positioning — at current revenue levels, both need either a pivot or a deliberate growth investment plan.

14. Conclusion

This analysis reveals a platform that is operationally strong at its core — ~93K completed rides, reliable weekday demand, and UPI-aligned payments — but faces meaningful headwinds from driver cancellations, supply gaps, and data quality gaps that are masking the true picture.

The most impactful interventions are: (1) reducing the ~27K driver cancellation volume through policy enforcement and UX design, (2) closing the ~11K 'No Driver Found' gap with targeted supply-side incentives, and (3) ensuring driver availability scales to match the ~50% weekend revenue premium opportunity.

With the right operational and data quality fixes in place, this platform has the foundation to materially improve both customer satisfaction and revenue per ride — particularly if vehicle-type and location-level data is enriched for the next round of analysis.
